Project Description:

The works were a design and build project to provide a 15,500 m² container handling storage facility adjoining an existing similar facility. The works comprised of the provision of a structural slab constructed using steel fibre reinforced concrete laid with a laser screed.

The works also included the provision of all drainage and high mast lighting to the slab area.

The existing facility had to remain operational 24 hours a day during the works. A traffic management plan was utilised to allow minimal disruption to the existing works.
